

Figma - Orision

Plan:

- How do we envision the flow for our Orision
- We decided to use the diagram template to visualize the flow for users

- Idea
 - When you first open up the page, it should prompt for a language selection, this is what the user is most familiar with. It will be a dropdown menu with the name of the language in native writing. (Update idea, or the user can say the name of the language output)
 - At this point there should be no "Make an account yet". The service is done first. After, there should be a follow up page asking if the user wants to save the history of the scan translation, voice call, etc. Sometimes the user does not want the tool to save data and use it for the future. If the user wants to save the session history, they will need to make an account- where they can see changes and continuities in their plan. Or, if they do not want to provide the whole context again, or if they do so the answer is more complete with context.
 - The three buttons they pick will be icon focused, more visual + native texts

Captured the iteration process (not just the final mock)

Before saving:

"Do you want to save this for later?"

Clear, simple choices. No forced storage.

Reasoning >

I'll help you build Orision. This is a multi-screen app with complex navigation, so let me start by loading guidance for routing.

Worked with 2 files >

Reasoning >

I'll build Orision with proper routing for all screens. Starting with the router setup and core screens.

Iteration 1:

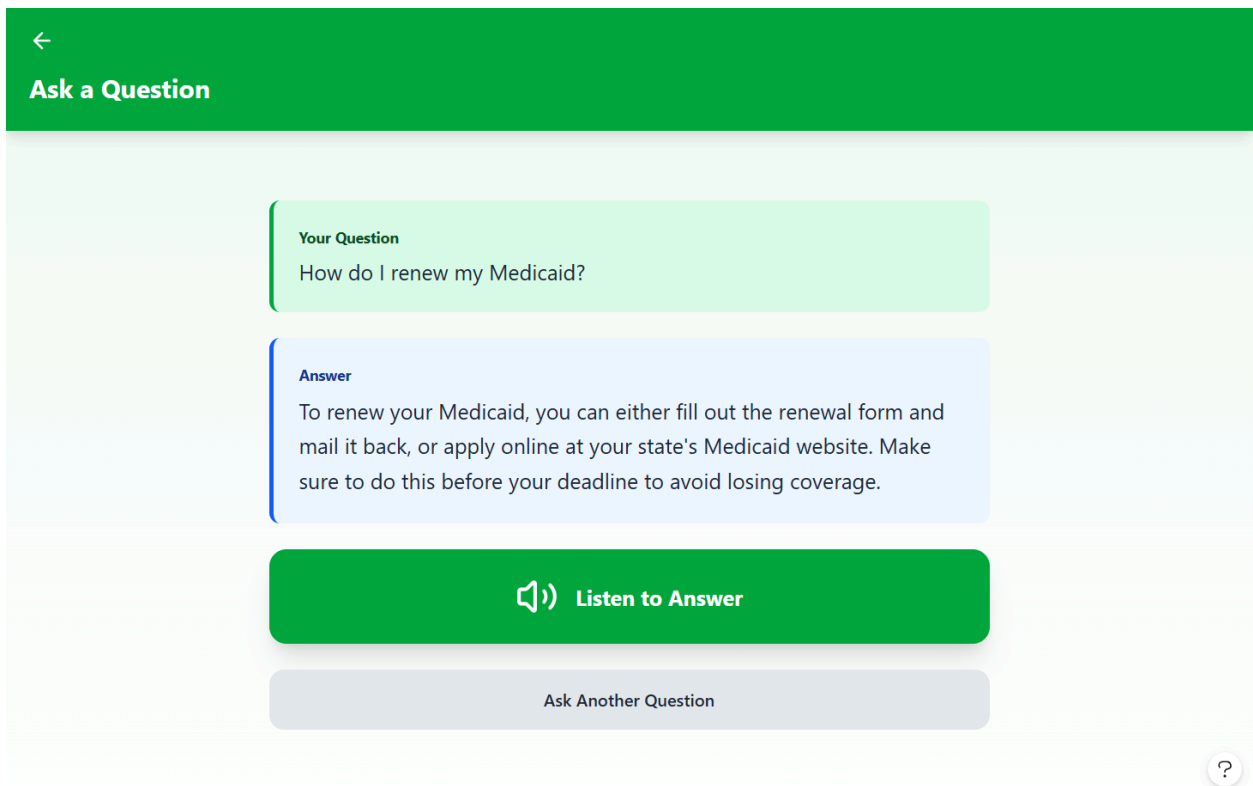

Iteration 2:

This change changes the big “Speak your Language” into a smaller microphone in a searchable box, this is because sometimes finding the language may be time consuming, the user can just speak into the microphone.

Mock screen 1 in Figma Make: photo capture + translation + audio play button

Mock screen 2 in Figma Make: live call screen with bilingual transcript

Narrative paragraph: We mocked the home screen in Figma Make with multiple layout buttons and text-based navigation. We realized this required users to read and choose, which slowed them down. We changed the design to a voice-first interface with a large “Speak” option, making it faster and easier for users to get help immediately.

Benefit of FigmaMake: Figma Make lets us rapidly prototype and iterate on user flows and layouts in minutes, allowing us to test usability decisions without spending time building and debugging code.
